ETHASFISH FARMS
LAKE VICTORIA · KENYA

Operations Manual

The complete staff guide to running the Ethasfish portal — from recording a harvest on the cages, through outlet stock and the point of sale, to customer credit, rider dispatch and the farm's sensors and cameras. Every screen in this book is a real capture of the live system.

WHAT'S INSIDE

Contents

Twelve sections follow the flow of a working day: open the portal, take stock, sell, settle credit, manage the storefront customers see, dispatch riders and watch the farm itself.

01 Getting started — the portal at a glance 4
02 Stock taking — harvest, send-out & outlet sales 5
03 The stockist assistant — asking and recording by chat 7
04 Point of sale — ringing up a counter order 8
05 Credit — buy now, pay later 10
06 Orders — fulfilment & the owed queue 12
07 Products — pricing, variants & stock levels 14
08 Site content — managing what customers see 15
09 The customer storefront 16
10 Deliveries — dispatch, riders & live tracking 17
11 Farm cameras — the video wall 21
12 Farm intelligence — sensors, alerts & the advisor 22
★ The daily close — checklist 23

How to use this manual. Each section opens with what the screen is for, then a numbered walkthrough, then a full-width capture of the real interface. Follow the numbers on the page — they match the fields on the screen.

00

One system, the whole business.

Ethasfish Farms runs on a single portal. The fish counted on the cages this morning are the same stock the outlet sells this afternoon, the same products the online shop offers tonight — and the same balances the credit ledger tracks when a customer pays later. An order taken online can be on a rider's bike minutes later, tracked live by the customer until it lands. Nothing is entered twice.

For sales staff. You will live in three places: **Stock** (harvest, send-out, outlet sales), **Point of Sale** (counter orders and receipts), and **Orders** (following up and taking payment).

For admins. Everything above, plus products and pricing, credit, purchasing, accounting, the media library, the website, the rider dispatch board, the farm cameras and the live sensor dashboard.

> **Sign in once.** The portal uses your staff account. If you can see the Dashboard with today's numbers, you are signed in and everything below is live data — not a demo.

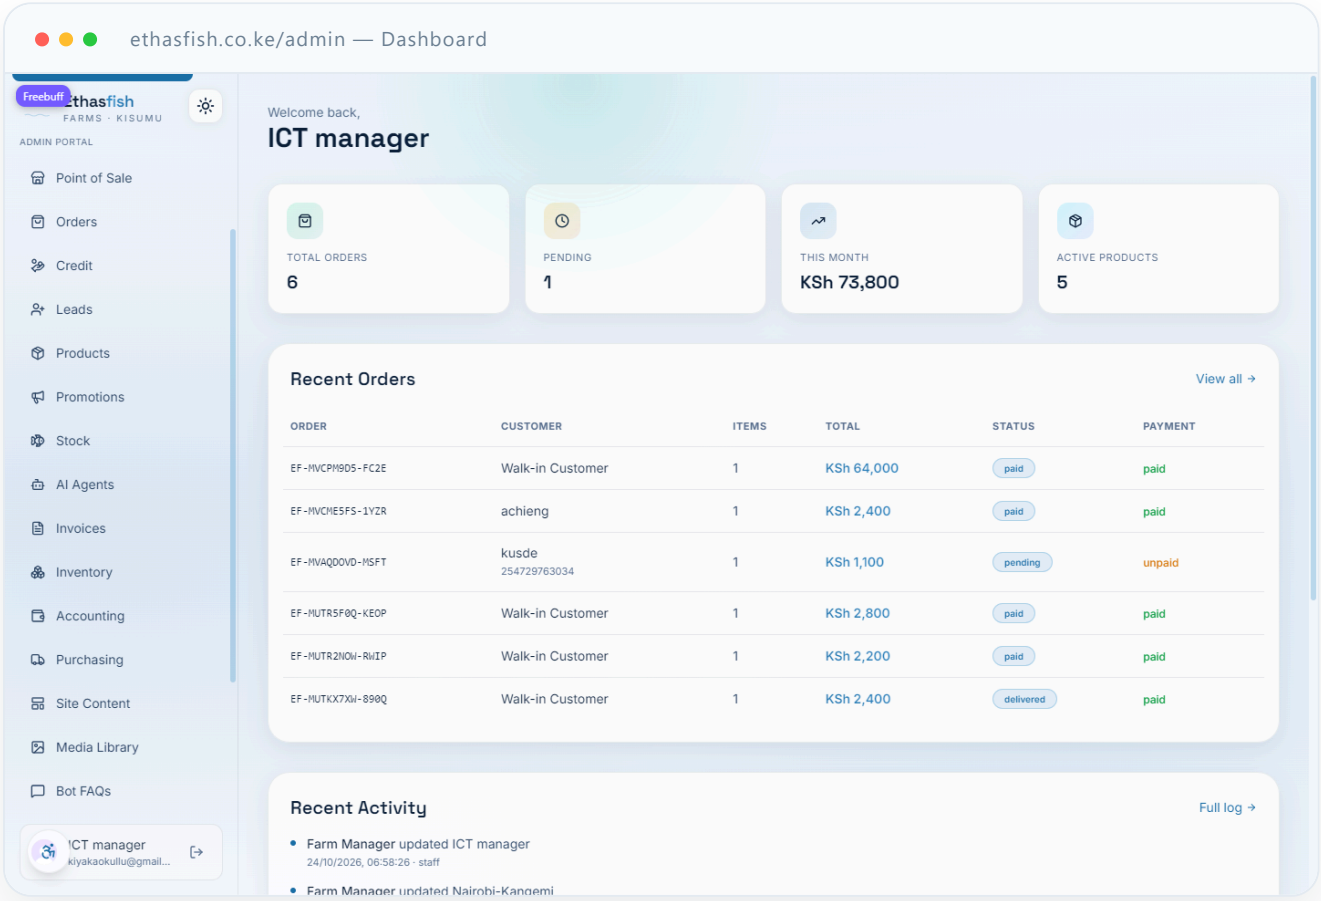

SECTION 01

The dashboard — your morning brief

Open the portal and you land here. Four tiles tell you the state of the business before you touch anything: how many orders exist, how many are still pending, what has taken in this month, and how many products are live. Below them, the eight most recent orders.

1. **Total Orders** — every order ever placed, online and at the counter.
2. **Pending** — orders awaiting fulfilment. Anything here needs attention today.
3. **This Month** — cash actually received this calendar month (paid orders only).
4. **Active Products** — items currently visible and sellable.

> **Start every shift here.** Glance at Pending, then check the Credit tile in the sidebar if you have debtors — before you start selling.

SECTION 02

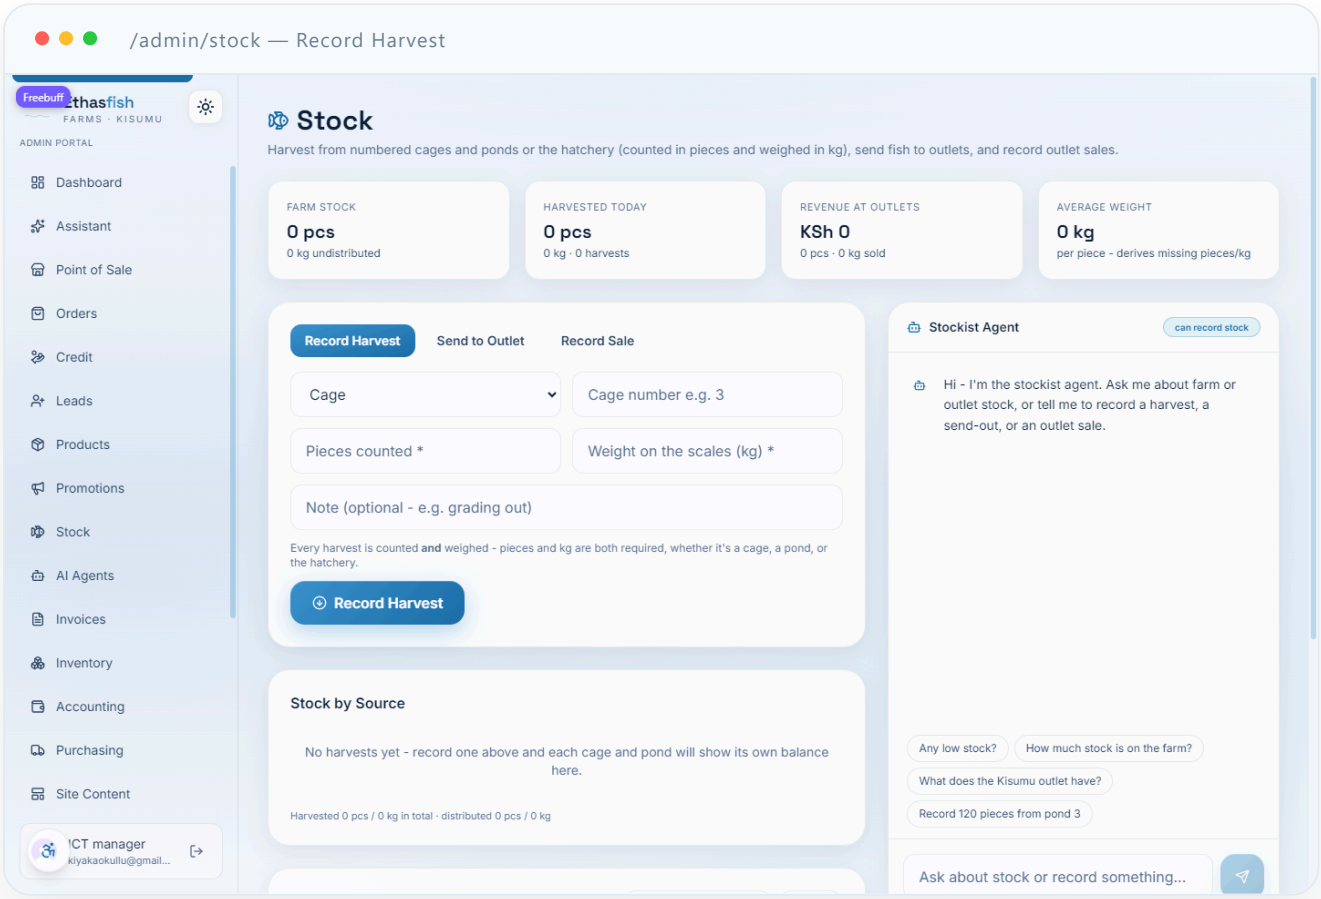

Stock taking — from the cage to the counter

The Stock page is the heartbeat of the operation. Fish are **harvested** from numbered cages, ponds or the hatchery, **sent out** to an outlet, and **sold** at that outlet. Every harvest is counted in pieces **and** weighed in kilograms — both are required, so the average weight stays honest and missing figures can be derived.

Record Harvest. Pick cage / pond / hatchery, enter the number, the kg on the scales, save.

Send to Outlet. Move stock from farm balance to an outlet. Fill either field; the rest derives.

Record Sale. Log what an outlet sold and the cash taken. Stock can't go negative.

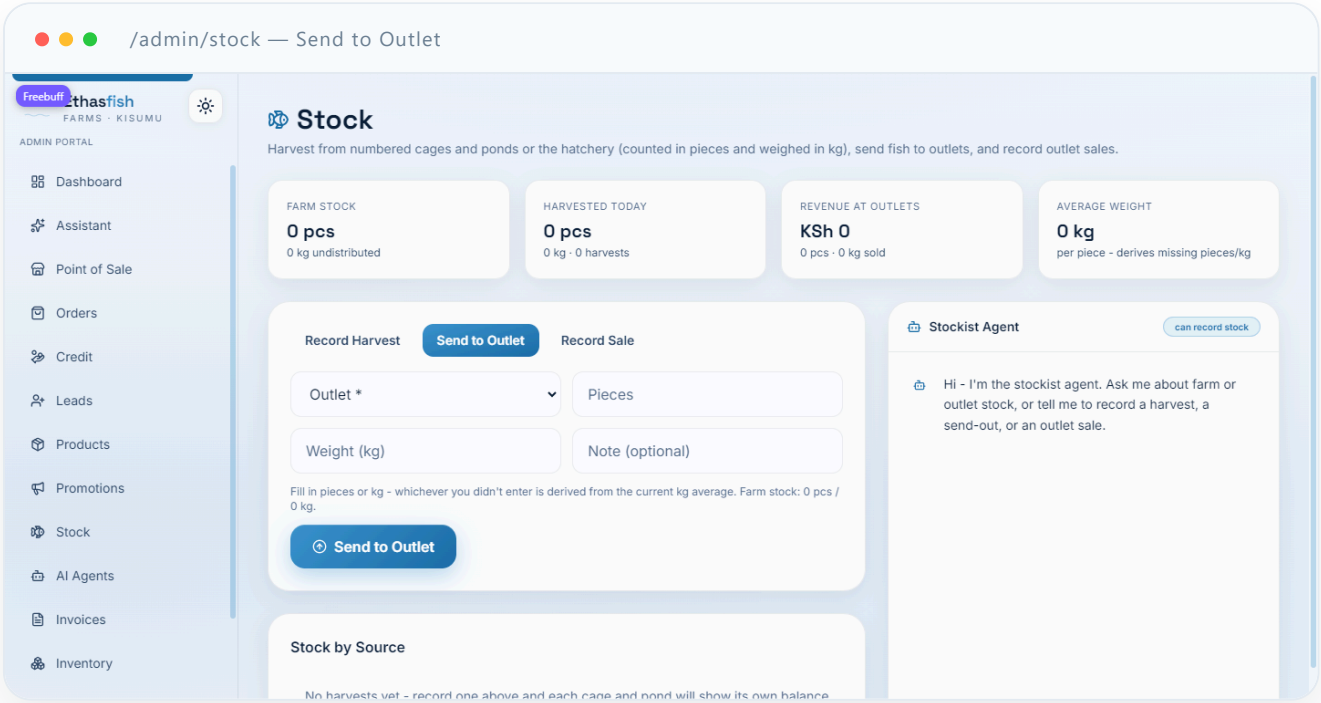

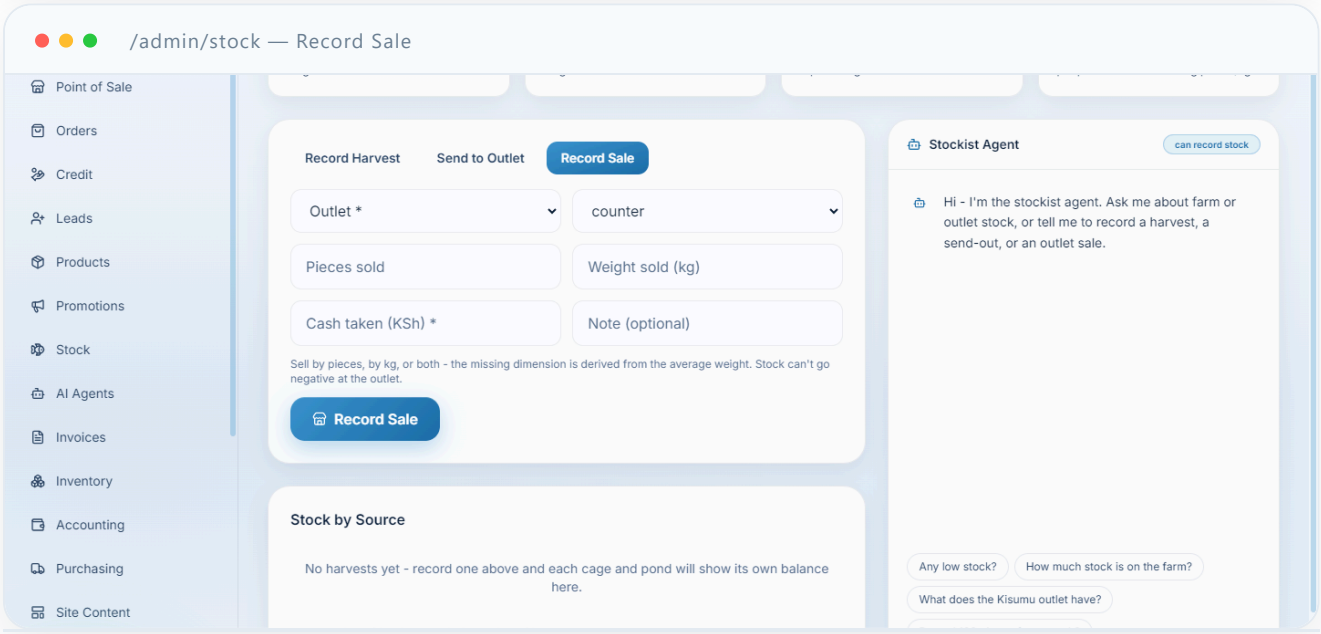

SECTION 02 · CONTINUED

Sending stock out & recording outlet sales

The snapshot tiles at the top of the Stock page update live: farm stock on hand, what was harvested today, revenue collected at outlets, and the current average weight per piece. Below the forms, **Stock by Source** keeps a running balance for each cage and pond, and the **Outlets** cards show what each location holds, has sold, and where the low-stock alert sits.

1. Open **Send to Outlet**, choose the destination, enter pieces and/or kg, save. Farm stock falls, outlet stock rises.
2. Open **Record Sale**, pick the outlet and a channel (counter, wholesale, mobile, market), enter what sold and the cash taken.
3. Set each outlet's **low-stock alert** (admin) so you are warned before a location runs dry.

SECTION 03

The stockist agent — stock by conversation

On the right of the Stock page sits the stockist agent. Ask it anything about stock, or tell it to record something, in plain language. It reads the same live balances you see, and it has permission to write harvests, send-outs and outlet sales — so you can keep working without leaving the conversation.

TRY ONE OF THESE

1. **"Any low stock?"** — lists outlets under their alert threshold.
2. **"How much stock is on the farm?"** — the undistributed balance in pieces and kg.
3. **"What does the Kisumu outlet have?"** — one outlet's on-hand position.
4. **"Record 120 pieces from pond 3"** — writes the harvest and refreshes every figure.

Check before you trust. Anything the agent records shows up immediately in Stock by Source and the outlet cards — give it a glance to confirm it heard you right.

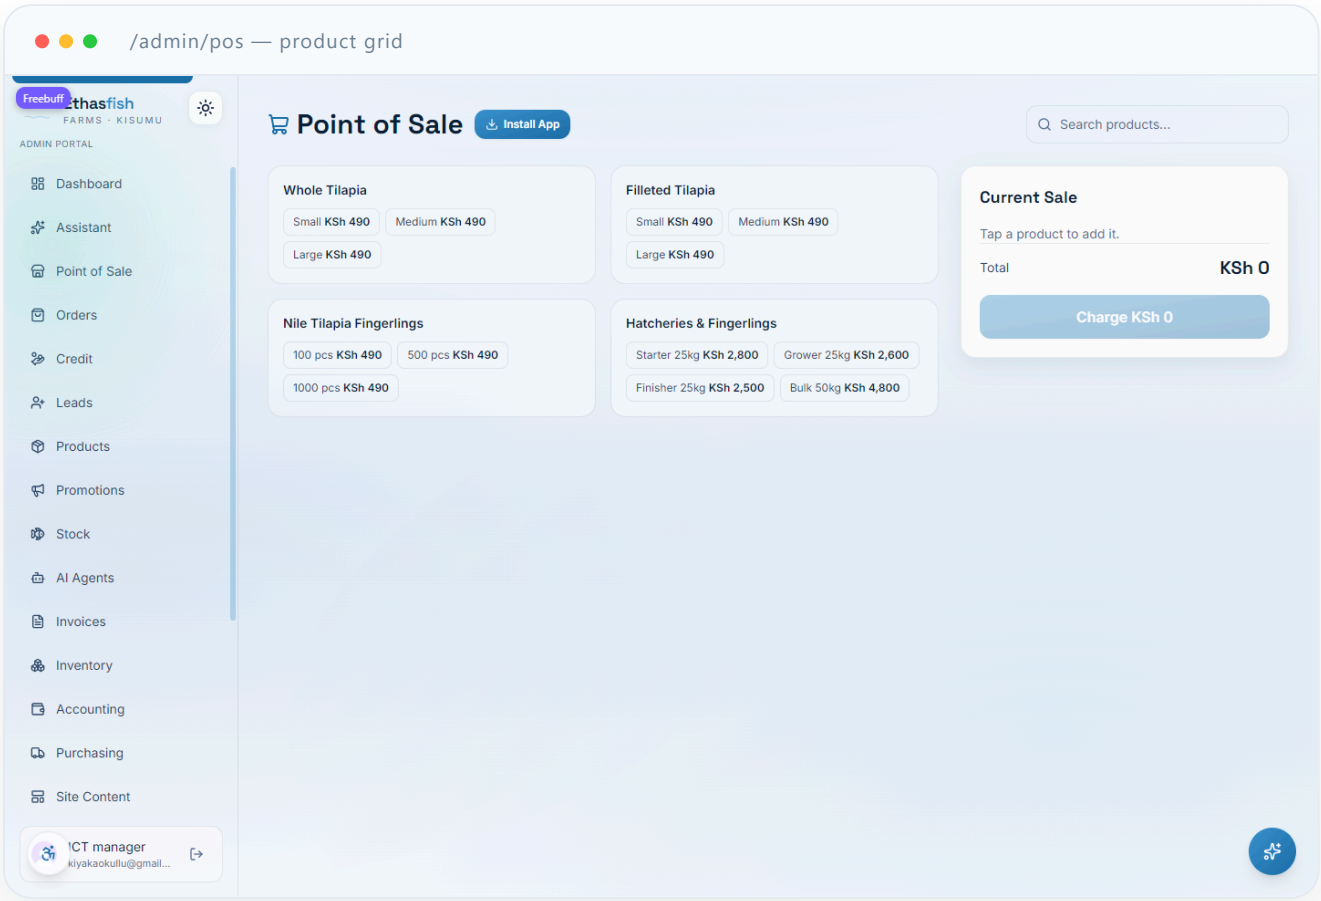

Why it matters. Hands wet, scale busy, phone ringing — typing a sentence is faster than hunting through three tabs. The agent does the navigating for you.

SECTION 04

Point of sale — ringing up a counter order

The POS is built for speed at the counter. Products appear as a grid of tiles with their live price and variant. Tap to add to the cart, adjust quantities, and check out — the sale writes an order, updates stock, and can print or send a receipt in one move.

1. **Find the product.** Tap its tile to drop one into the cart; tap again or use the stepper for more.
2. **Pick a variant.** Whole fish by size, fillets, fingerlings by pack — each carries its own price.
3. **Check out.** Choose how the customer is paying: cash, M-Pesa, or **Credit** (see Section 05).

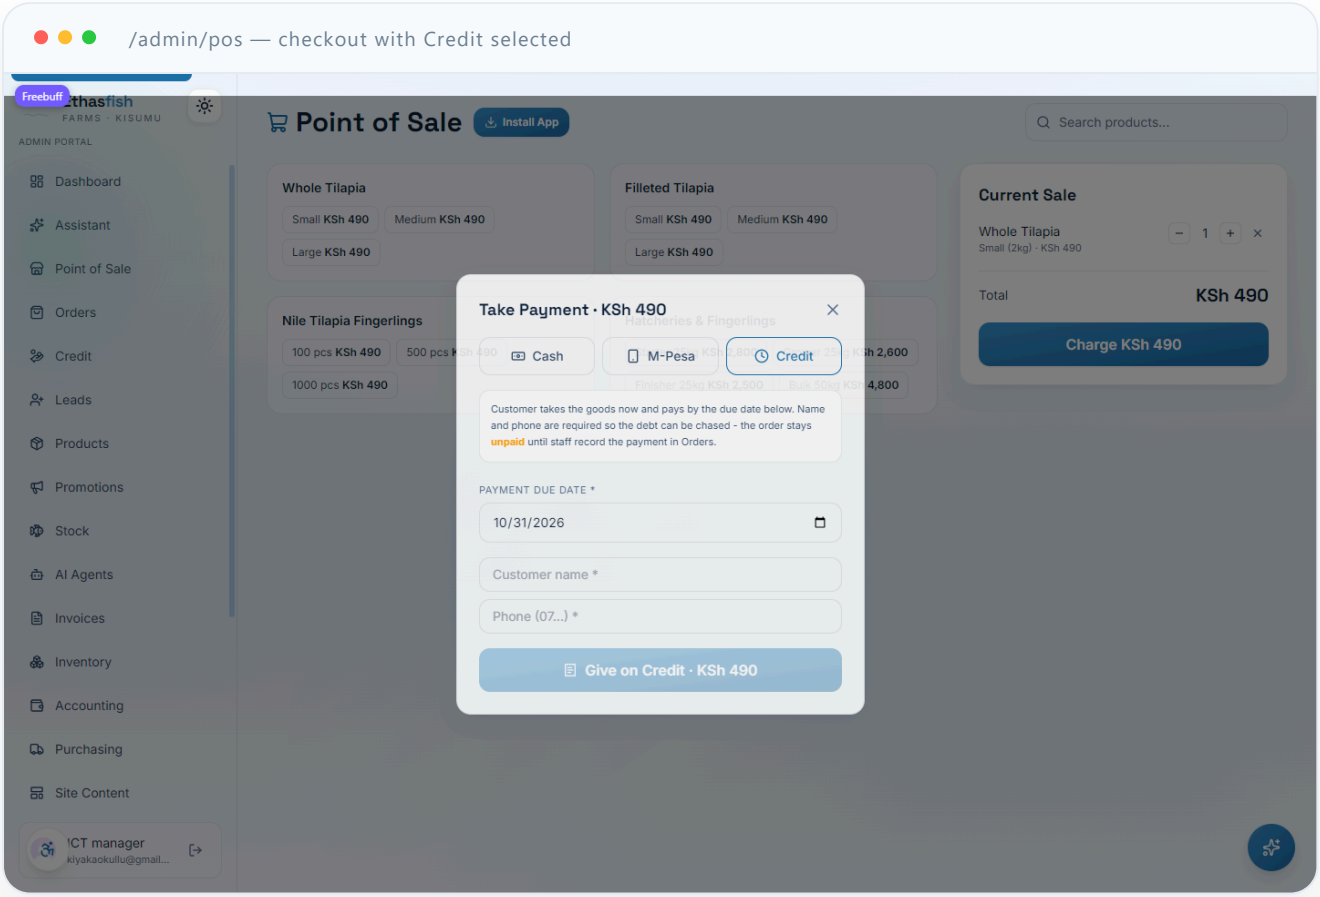

SECTION 04 · CONTINUED

Selling on credit at the counter

Some regulars take fish today and pay when the week's money lands. Choose **Credit** at checkout and the modal asks for what the ledger needs later: the **customer's name** and **phone**, and a **due date** by which they promise to settle. All three are required — an incomplete credit sale cannot slip through.

> **Never fudge the due date.** It drives the overdue flag on the Orders and Credit pages. If a customer asks for more time, agree it, then update the order — don't leave the original promise blank.

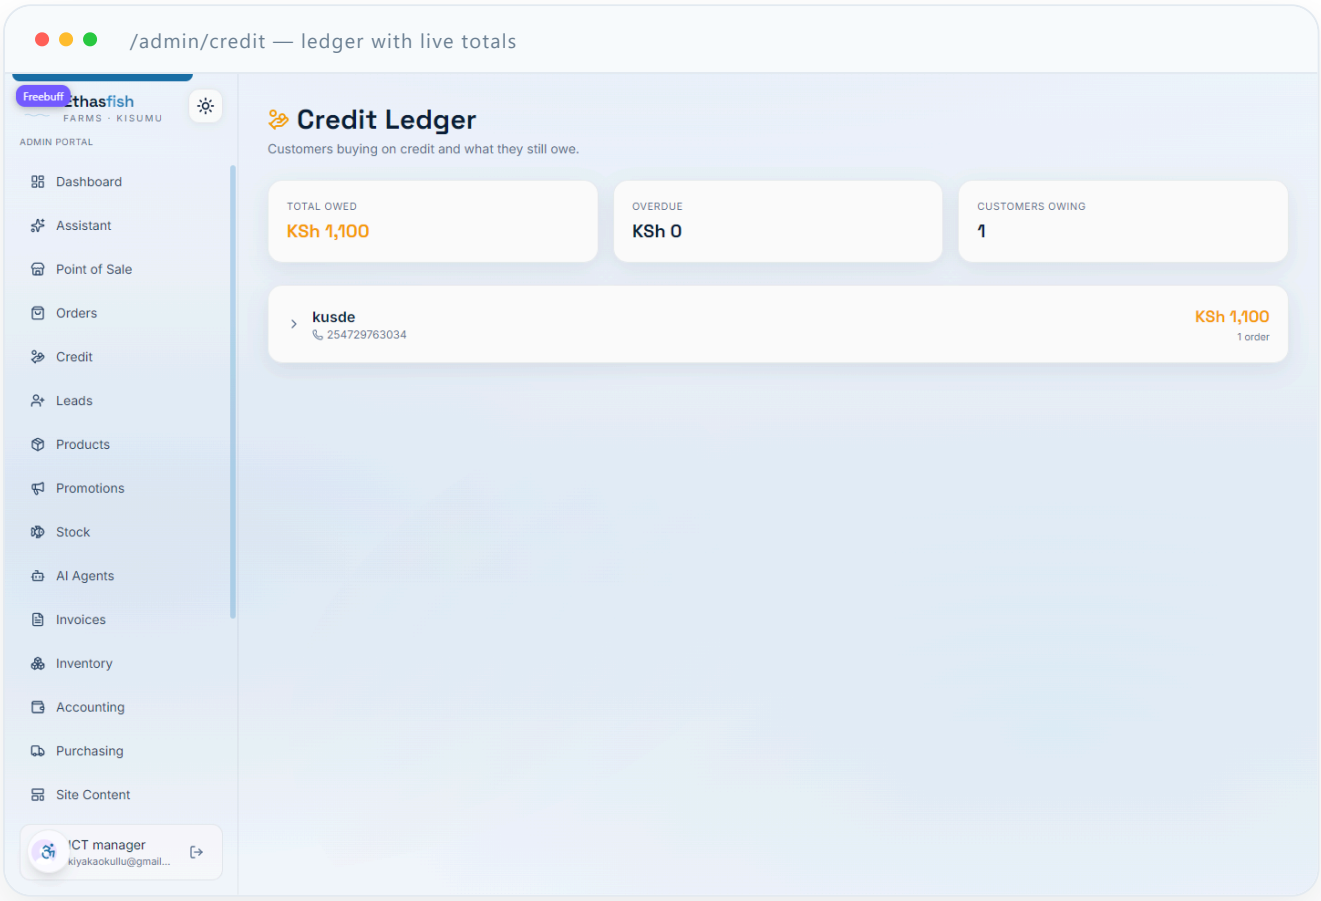

SECTION 05

Credit ledger — who owes what

The Credit page turns every unpaid credit order into a per-customer balance. Three tiles across the top give you the total owed, how much of it is overdue, and how many customers are carrying a balance. Each customer row expands to the individual orders behind their number, with the due date and days late spelled out.

1. **Total owed** — every shilling still outstanding across all credit customers.
2. **Overdue** — the portion past its due date. Shown in red; chase these first.
3. **Customers owing** — how many people to follow up with today.
4. **Expand a row** — see each order, its due date, and record a part-payment or full settlement.

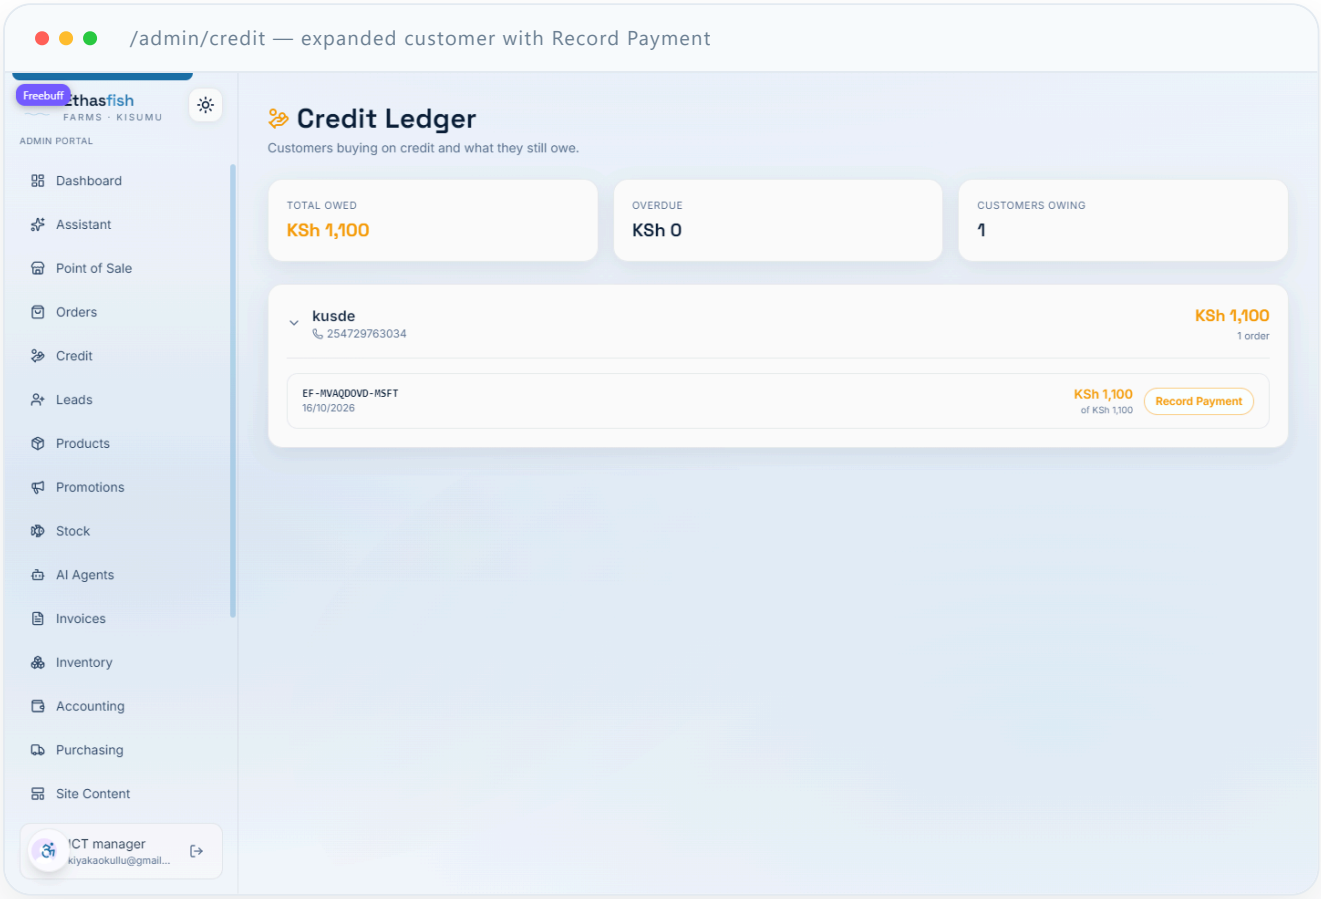

SECTION 05 · CONTINUED

Recording a payment against a debt

When money comes in — full or part — open the customer, hit **Record Payment**, and enter the amount. Choose how they paid (cash, M-Pesa, bank, mobile) and paste the reference code if there is one. A partial payment chips away at the balance; when the last shilling lands the order flips to **Settled in full** and drops off the owing list.

> **Always take the reference.** An M-Pesa code takes ten seconds to note and settles a "I already paid" conversation instantly.

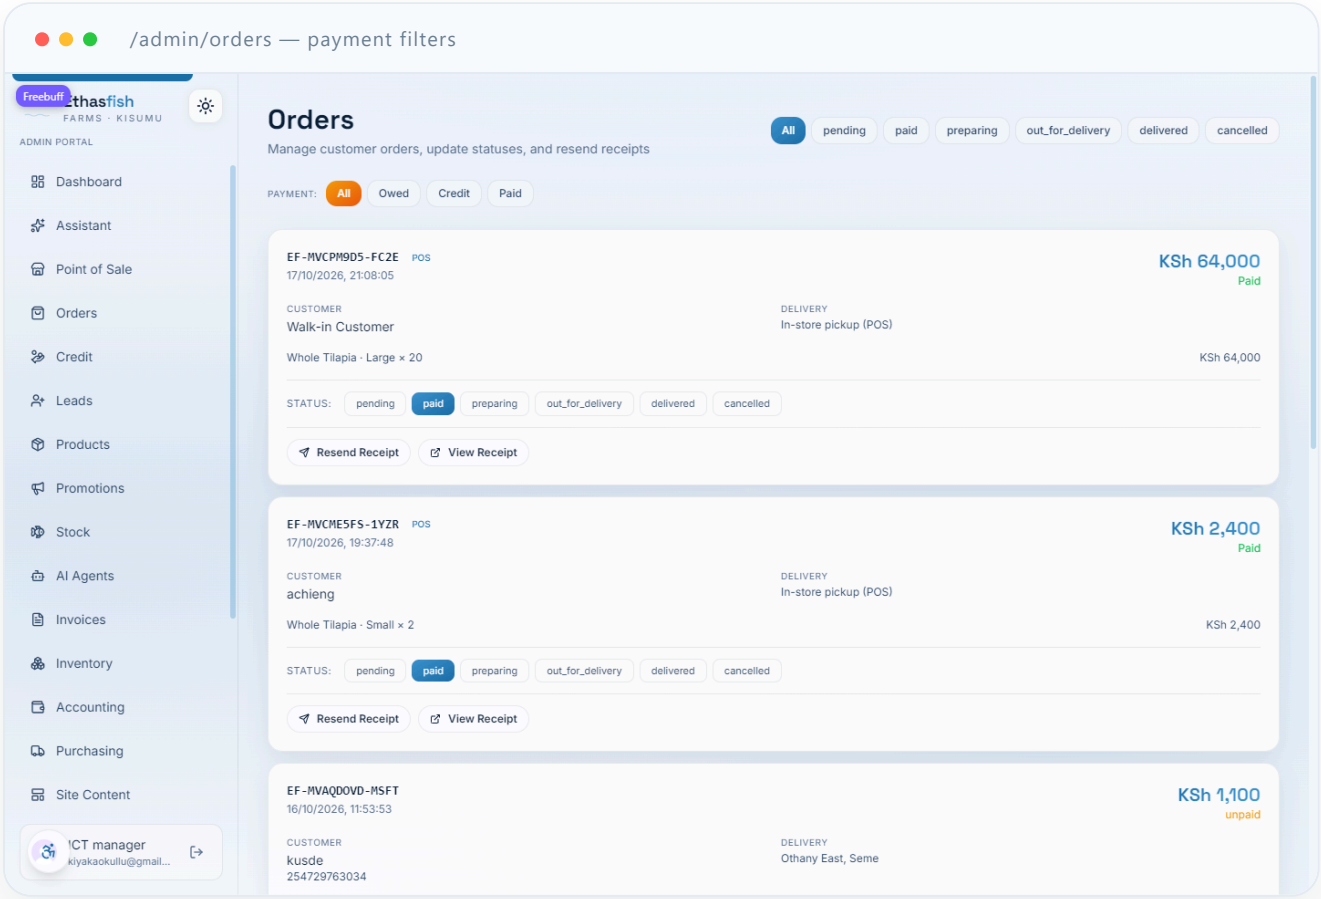

SECTION 06

Orders — the fulfilment queue

Every order, wherever it came from, lands in one list. A filter row lets you slice by status (pending, delivered, cancelled) and by **payment** — paid, or **Owed**. Overdue credit orders are ringed in red so a late payer never hides in the stack.

1. **Work top-down.** Oldest pending first — that's the fairest queue for customers.
2. **Use the Owed filter** to see everything bought on credit that hasn't been settled.
3. **Record Payment inline** from the order card — no need to visit the Credit page for a one-off.

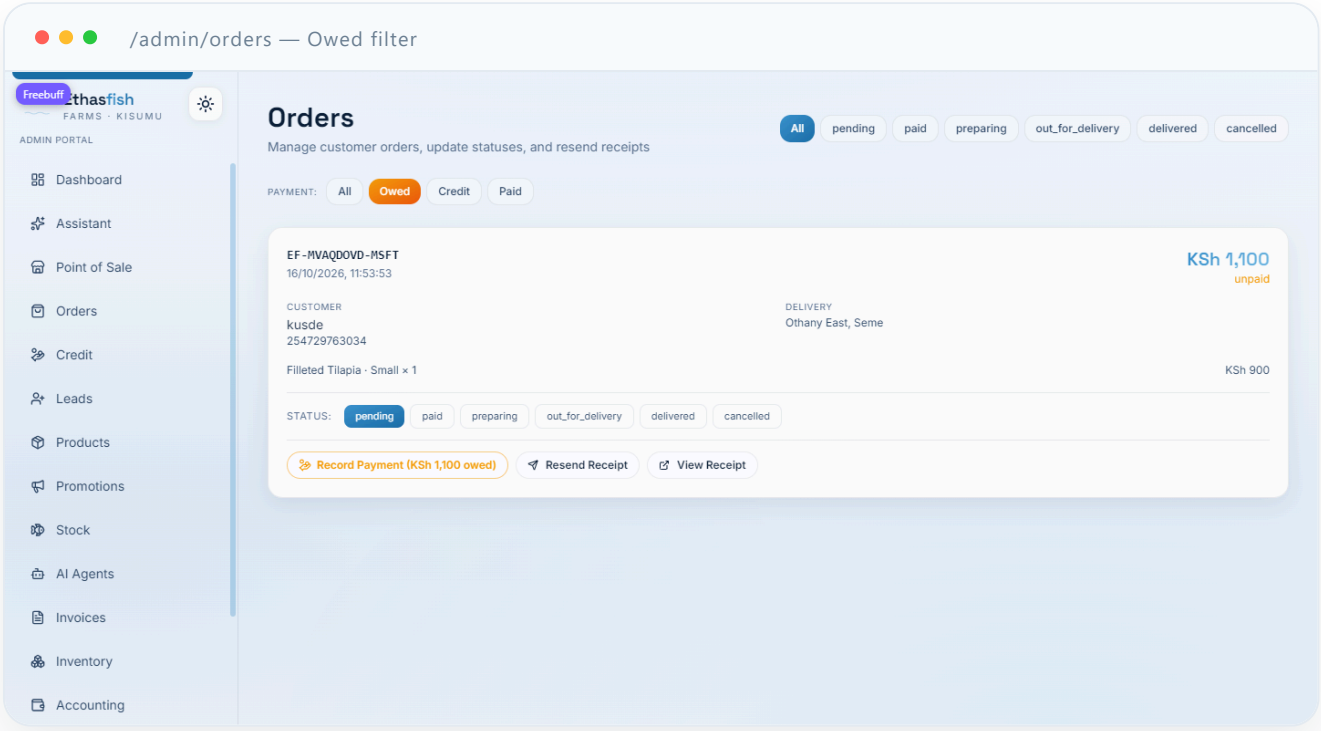

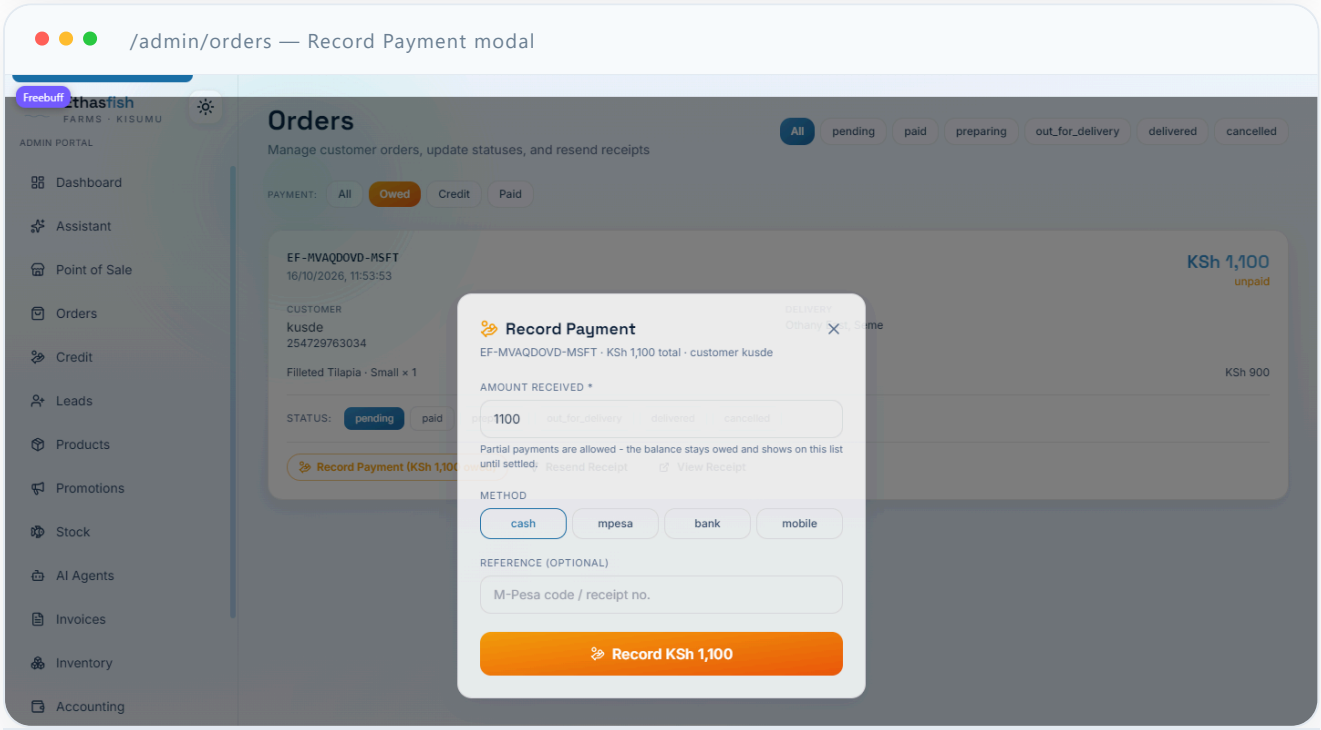

SECTION 06 · CONTINUED

The Owed queue — credit, surfaced

Switch the payment filter to **Owed** and the list narrows to unsettled credit orders. Each card carries an amber **Record Payment (KSh … owed)** button showing exactly how much is outstanding, and an overdue order is ringed in red. Tapping the button opens a focused modal — amount, method, reference — and returns you straight to the filtered list.

> **Chase, don't guess.** The owed list is your call sheet. Ring from the top, note every promise in the reference field, and record payments the moment money arrives.

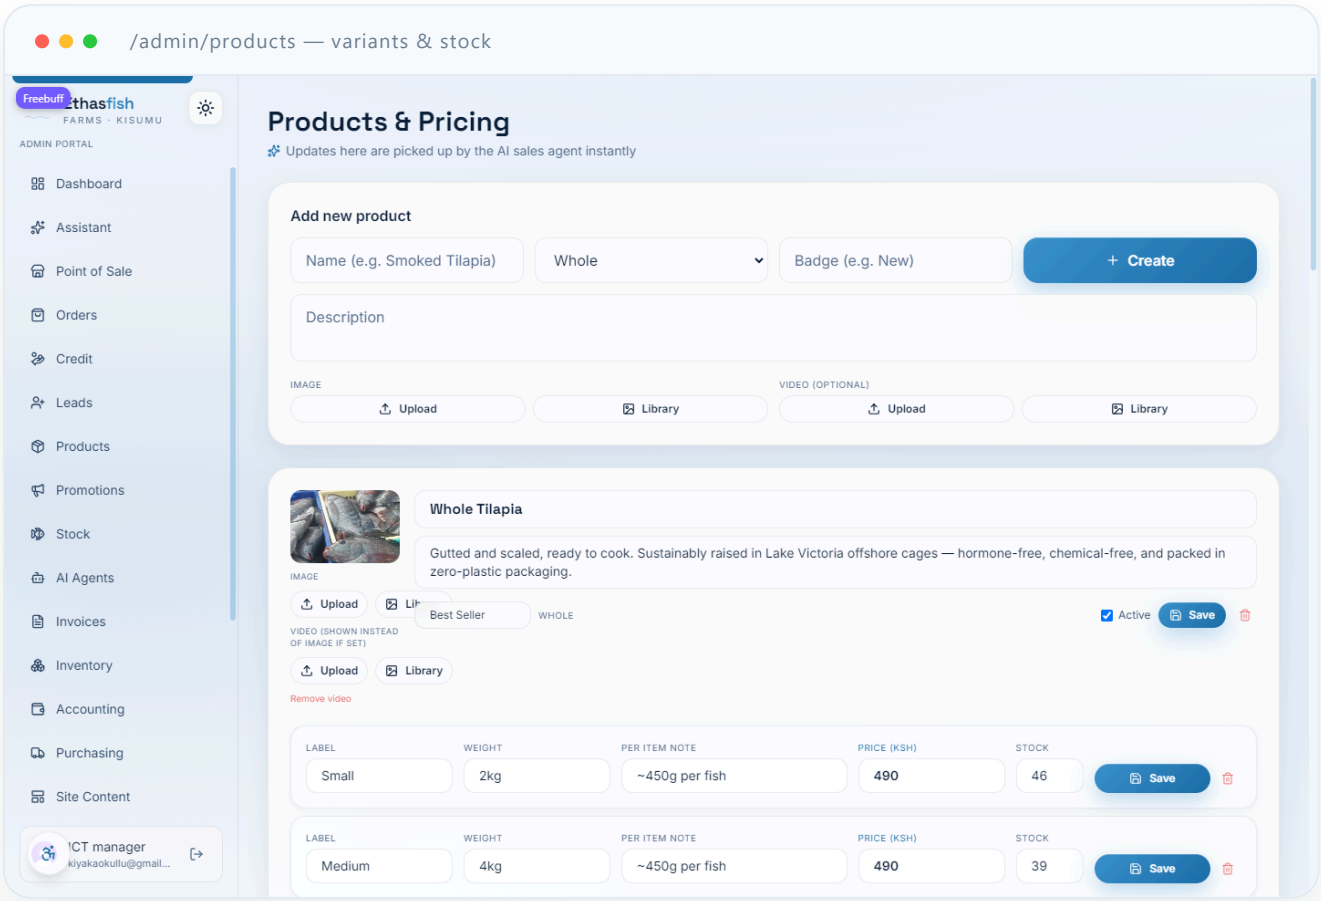

SECTION 07

Products — pricing, variants & stock

Products drives the shop, the POS tiles and what stock is tracked against. Each product carries a description, its category, and one or more **variants** — sizes like Small / Medium / Large, or pack counts for fingerlings — each with its own price. Toggle a product off and it disappears from the storefront without deleting its history.

1. **Price a variant** by editing its amount; the shop and POS pick it up immediately.
2. **Set stock per variant** so a sold-out size stops taking orders online.
3. **Add a variant** when you introduce a new size or pack — no code needed.

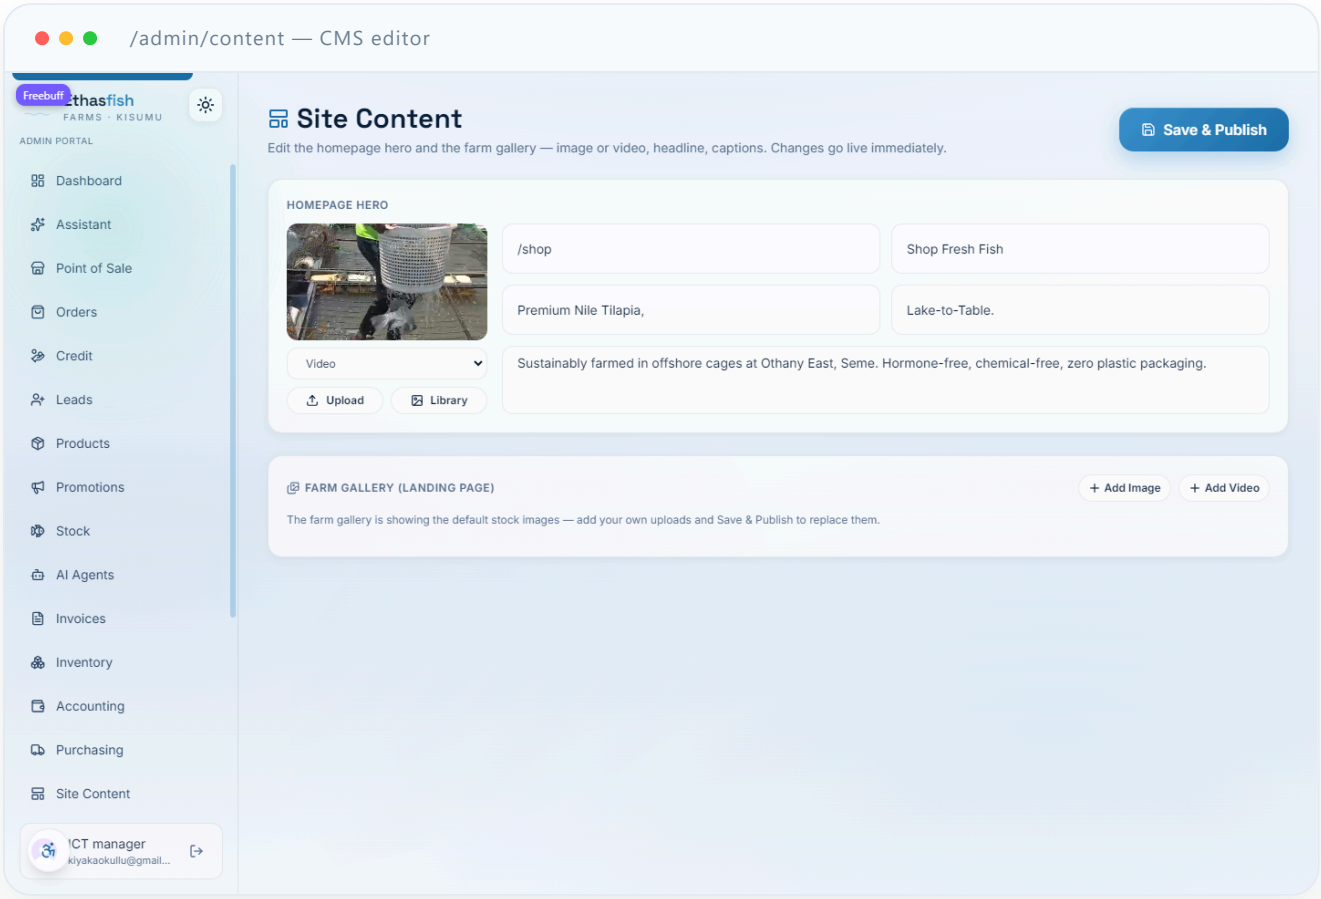

SECTION 08

Site content — the storefront in your hands

The public website is not a separate thing to ask a developer about. The Site Content editor lets an admin change the words, banners and imagery customers see — the hero headline, the promotional strip, service descriptions — and publish. Media lives in the **Media Library**, so photos uploaded once can be reused across pages.

> **Think before you publish.** Changes go live to every visitor. Preview the wording, check spelling, then save — and remember the same content powers the mobile site.

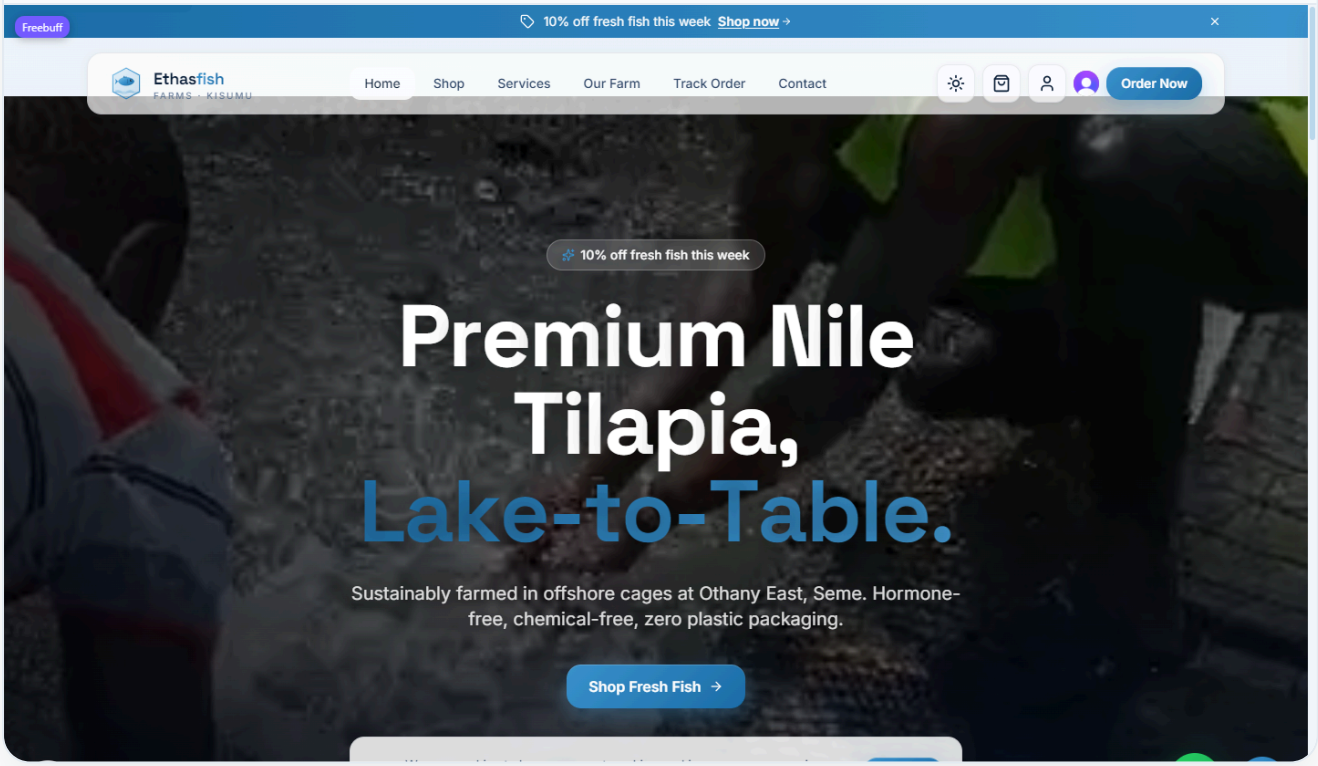

SECTION 09

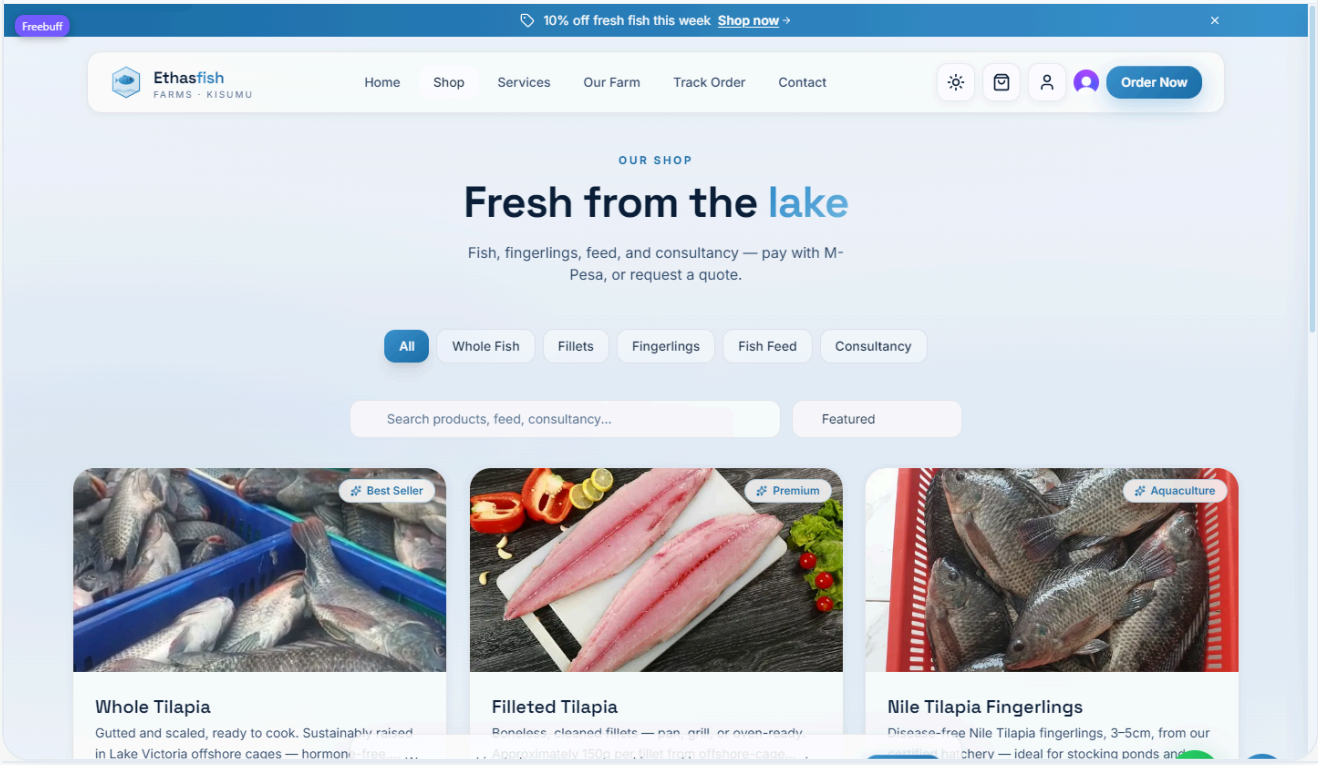

The storefront — what your customer sees

All your work lands here. The public site opens on a hero that sells Lake-to-Table tilapia, then flows into a shop grid of live products with category filters — whole fish, fillets, fingerlings, feed, consultancy. Customers pay by M-Pesa or request a quote, and their order drops straight into the same queue you fulfil.

/shop — live catalogue

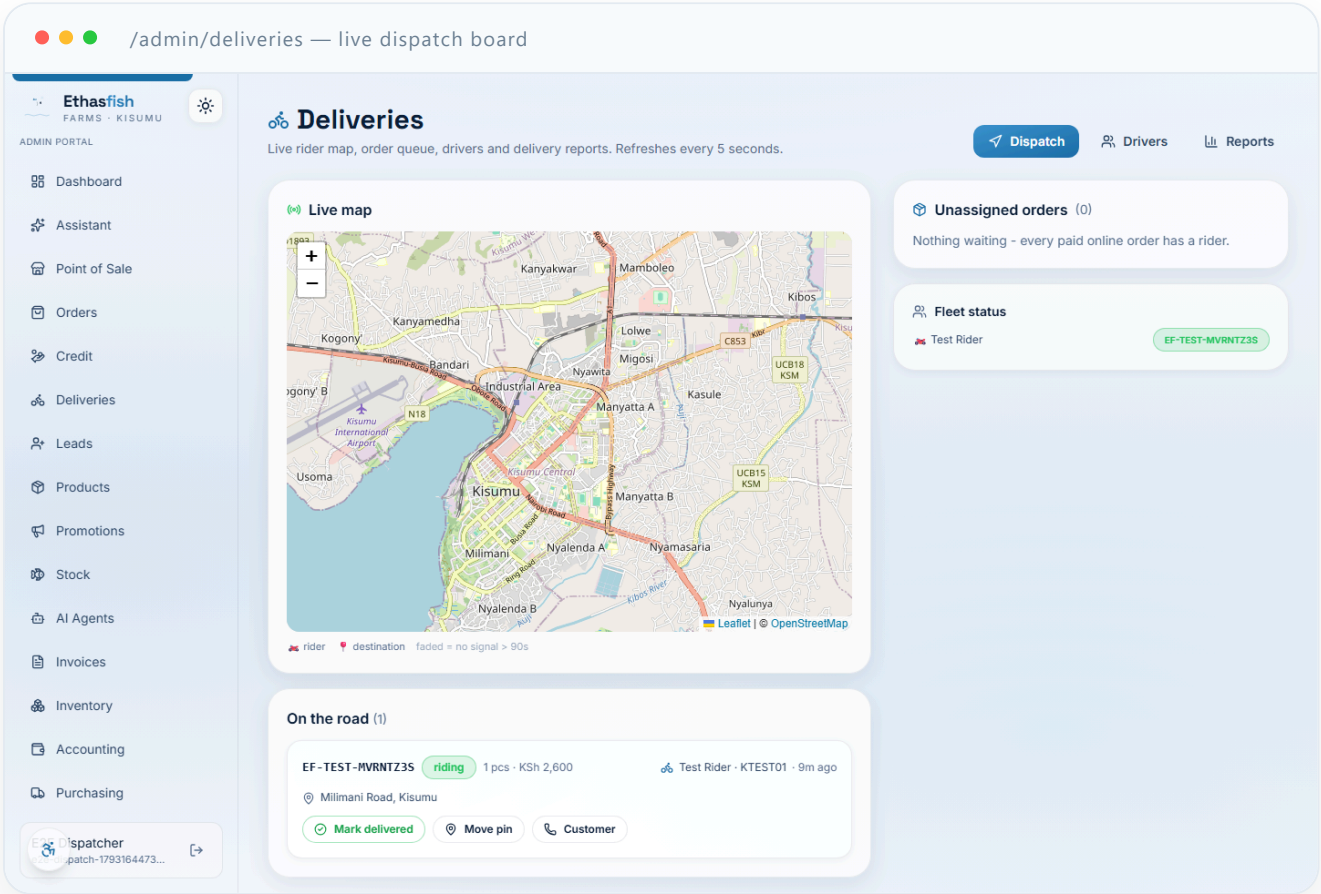

SECTION 10

Deliveries — the dispatch board

Every paid online order that needs a rider lands on **Admin → Deliveries**. The board refreshes every five seconds: a live map showing each rider and the destination pins, an **Unassigned orders** queue, the **On the road** list of active jobs, and a **Fleet status** card down the side showing who is carrying what.

1. **Assign.** Open an unassigned order and pick an idle rider — each choice shows their last signal, so you never book a phone that's been dark for an hour.
2. **Watch.** The rider's dot moves on the map as their phone sends GPS pings. A faded dot means no signal for over 90 seconds.
3. **Nudge. Move pin** fixes an address that geocoded wrongly; **Customer** dials the recipient without leaving the board.
4. **Close. Mark delivered** mirrors the rider's own tap — the order flips to delivered and leaves the road.

> **Map legend.** ● rider · ● destination · faded = no signal > 90s. The board is also where you cancel a job before pickup.

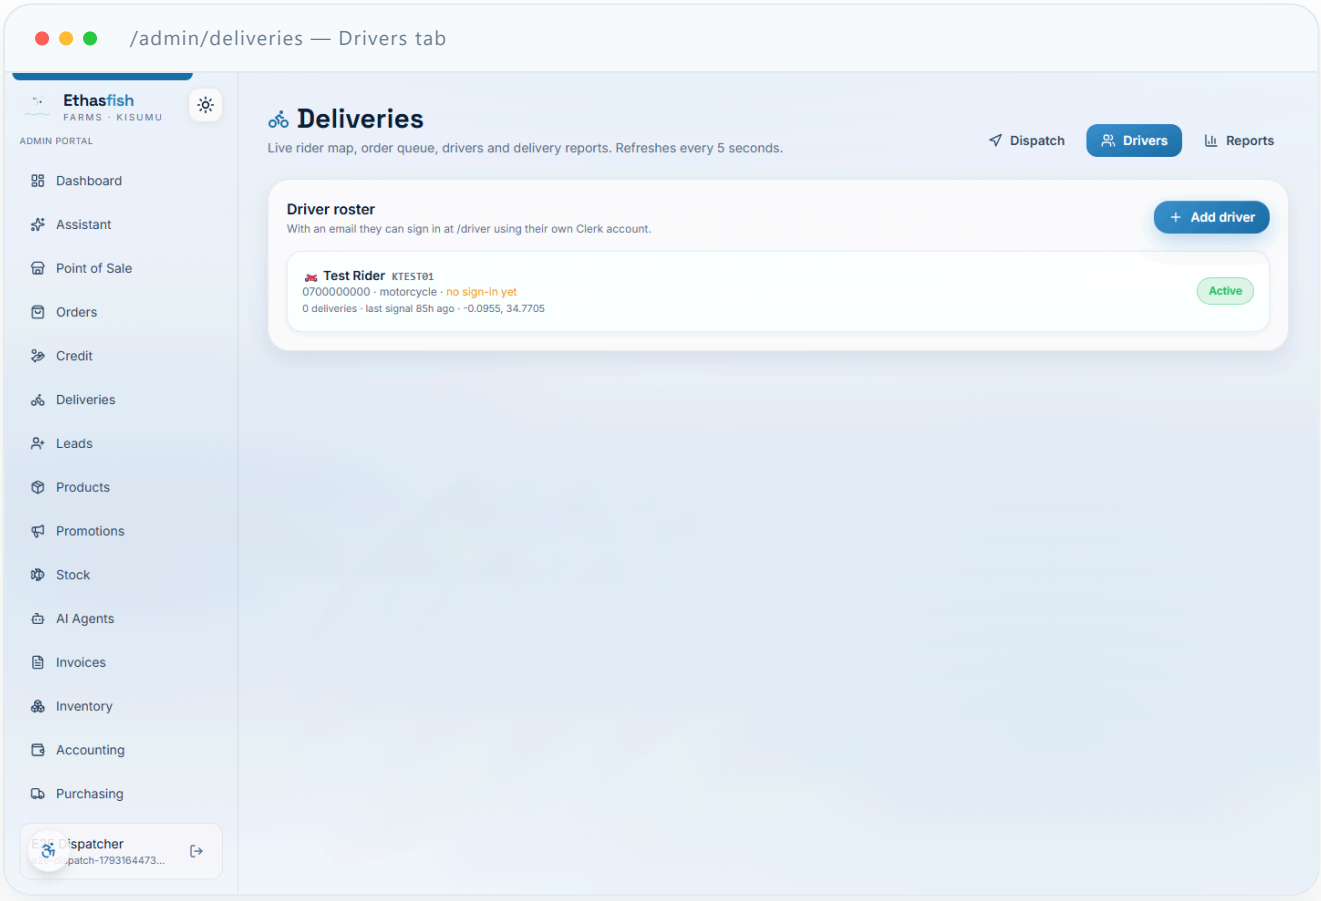

SECTION 10 · CONTINUED

Drivers & the rider phone app

The **Drivers** tab holds the fleet: name, phone, plate number, vehicle type (motorcycle, bicycle or van) and whether the person may sign in. Riders use their own phones: they sign into the rider app at **/driver**, see the jobs assigned to them, and tap once to collect and once to deliver. While a job is active the phone streams a GPS ping every few seconds — that is what moves the dot on your board and on the customer's tracking page.

1. **Add a driver.** Name and phone are required; plate and vehicle show up on the board and in the assign menu.
2. **Link their sign-in.** Attach a staff email so they can open the rider app — a driver with no sign-in yet is flagged in amber on the card.
3. **Assign work.** The dispatch queue only offers **idle, active** riders; off-duty riders can't be booked.
4. **One-tap flow.** Collect → Delivered on the phone. GPS pings stop the moment the job ends or the tab is hidden — battery matters more than a perfect trail.

> **Lost phone?** Mark the rider **off** (or block their staff account) and their current job returns to the unassigned queue — no rider can keep a job after sign-out.

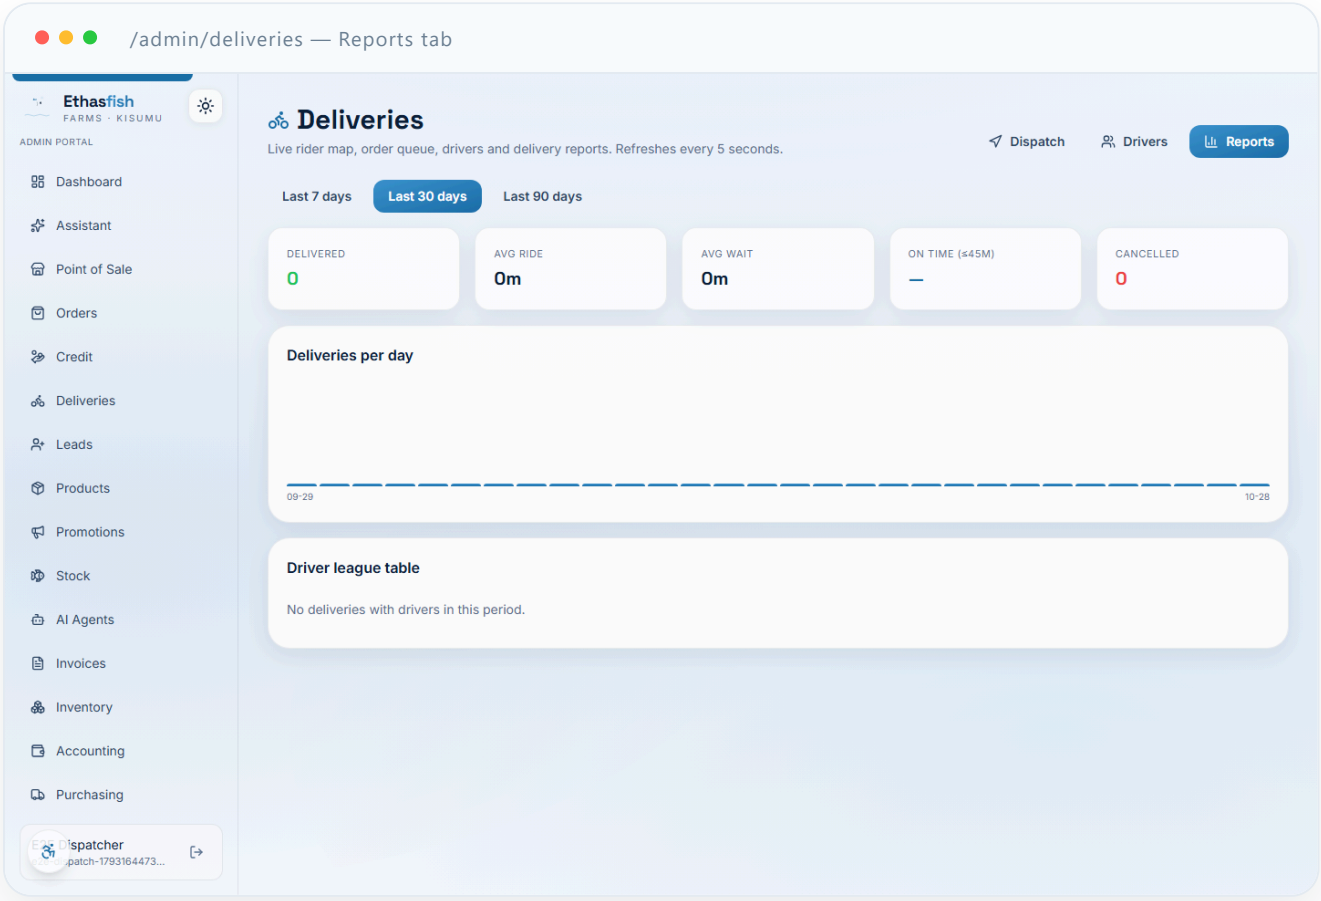

SECTION 10 · CONTINUED

Delivery reports — volumes, speed & the league table

The **Reports** tab answers the manager's questions without a spreadsheet: how many deliveries went out and when, how long rides take on average, how far the fleet travels, and a per-driver league table ranking delivered jobs, average ride time, total kilometres and cancellations.

1. **Volume trend.** Spot your busy days and put another rider on shift before they happen again.
2. **Speed.** Average ride minutes and kilometres — a rising trend usually means prep delays, not slow bikes.
3. **League table.** Celebrate the top rider, and open a conversation where cancellations cluster.

> **Review weekly.** Ten minutes on this page every Monday tells you whether you need more riders, better packing, or clearer addresses at checkout.

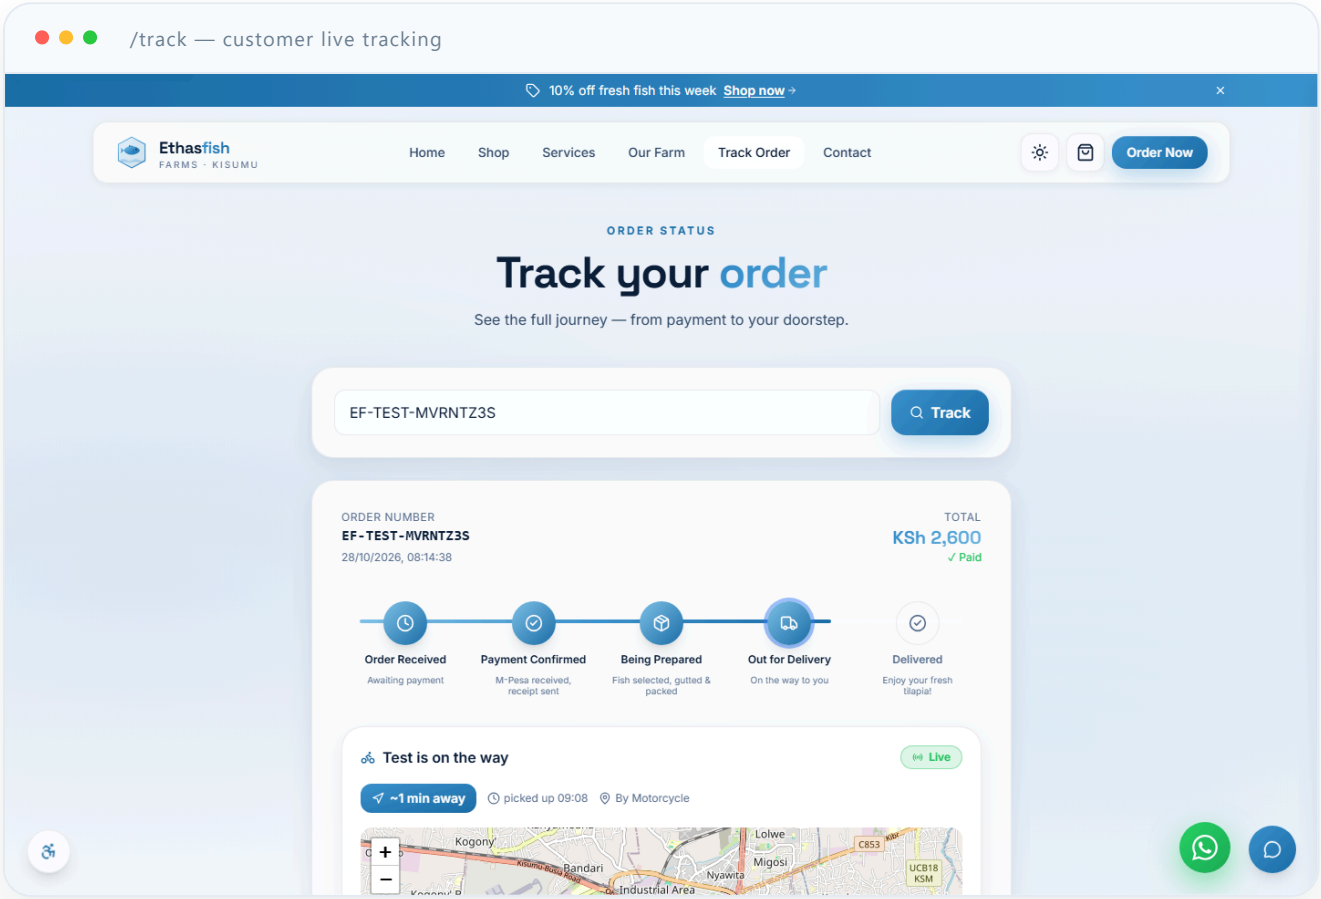

SECTION 10 · CONTINUED

Live tracking — what the customer sees

Customers don't ring to ask “where is it?” — every receipt carries a track link. The public **/track** page takes the order number and shows the five-stage journey, then, once a rider picks up, a live map with the rider's dot, first name, vehicle and an **ETA chip** that counts down until delivery. It is your dispatch board's data, trimmed to what a customer may see: no phone numbers, no internal ids, no fleet-wide positions.

1. **Share the link.** WhatsApp, SMS and email receipts already include it — nothing extra to send.
2. **Rider assigned** — “Rider assigned — collecting your order”.
3. **Picked up** — the live dot appears with a green **Live** badge and the ETA, refreshing every 5 seconds.
4. **Delivered** — the timeline completes and the live block retires into the stage history.

> **Same pin, same truth.** If the destination lands wrong, fix it once with **Move pin** on the dispatch board — the customer's map corrects itself on the next refresh.

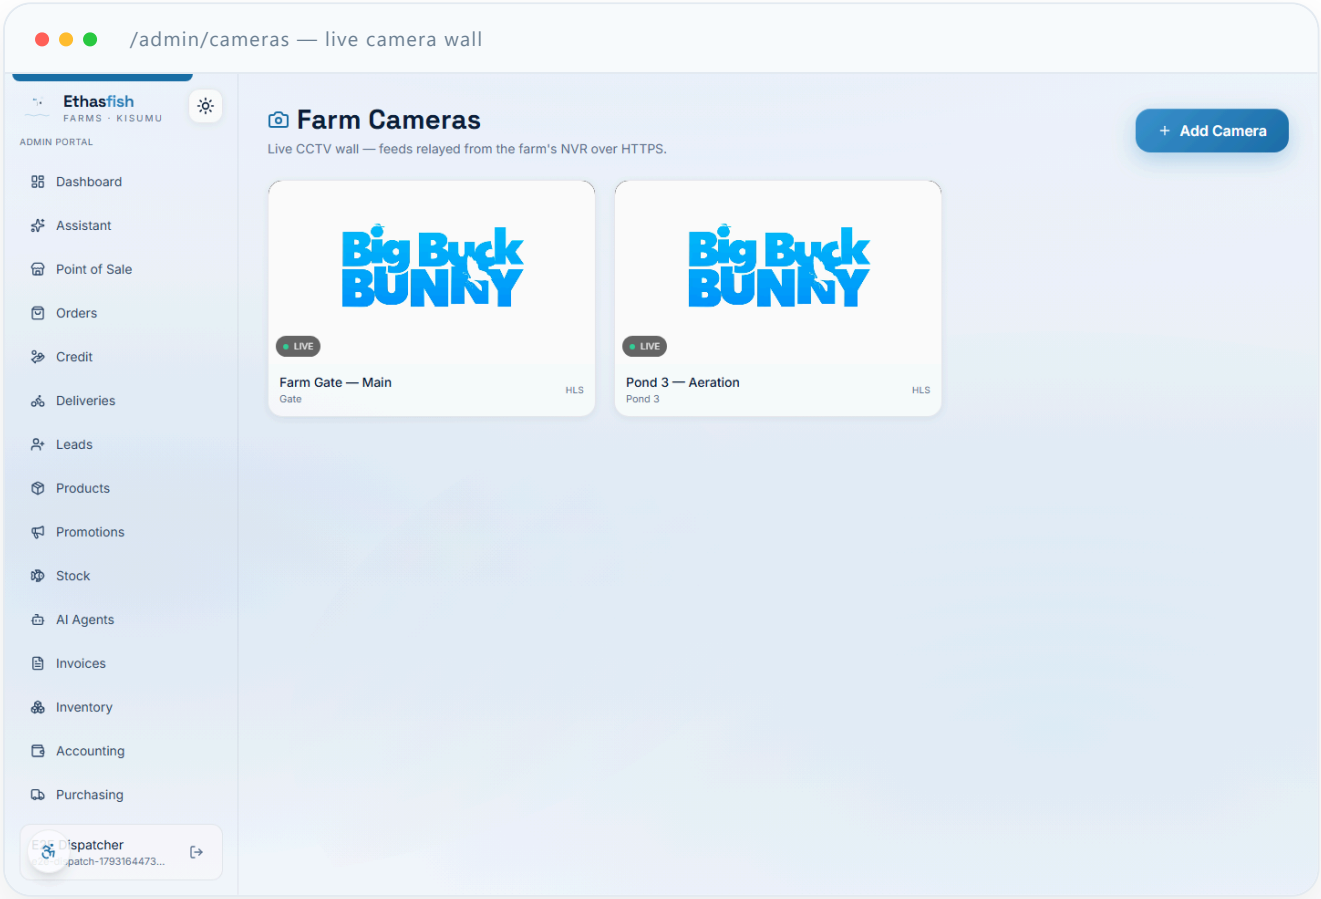

SECTION 11

Farm cameras — the video wall

Admin → Cameras brings the farm's CCTV into the portal: a grid of live tiles for the gates, ponds, stores and curing rooms, each marked **LIVE** or **OFFLINE** at a glance. Add a camera with its name, the area it covers and its stream URL — the tile then plays whatever that URL offers: an HLS playlist, the web viewer of the farm's recorder, or a snapshot image refreshed every few seconds.

1. **Add a camera.** Name, area, URL and type — HLS streams play inline, embed URLs show the recorder's own viewer, image URLs poll a JPEG.
2. **Watch the wall.** Every tile plays at once; status tells you instantly which feeds are answering.
3. **Edit or remove** a feed from its tile when the farm rearranges cameras.

> **RTSP is rejected on purpose.** Browsers cannot play raw `rtsp://` links — the farm's always-on NVR or relay PC must expose each camera over HTTPS first (see README → Farm cameras). A tile stuck OFFLINE means the relay, not the portal.

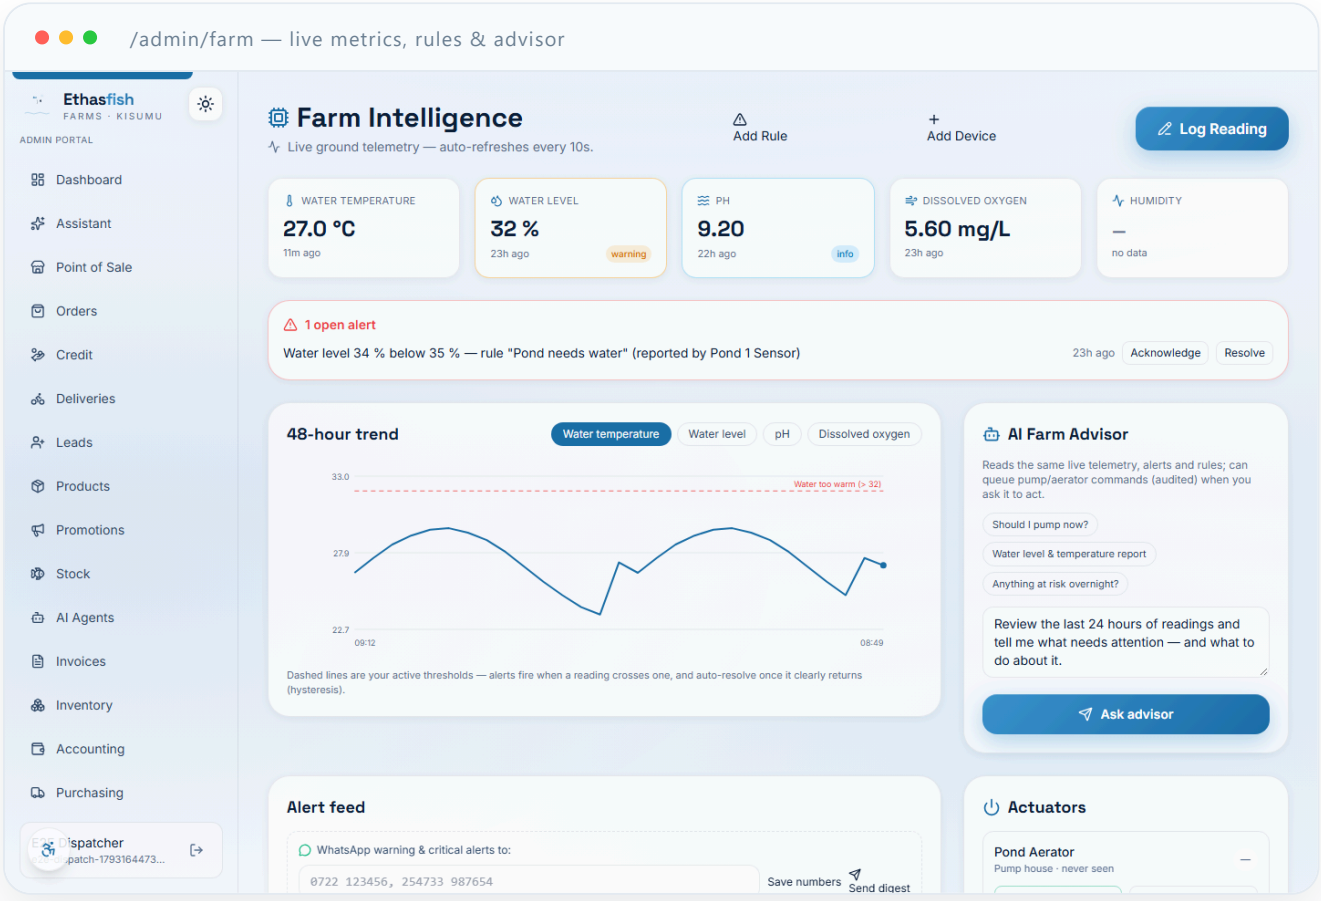

SECTION 12

Farm intelligence — sensors, alerts & the advisor

Admin → Farm Intelligence is the ground view. Field devices push water temperature, water level, pH, dissolved oxygen and humidity; the page turns those into live metric cards coloured by your rules, a 48-hour trend chart with the thresholds drawn straight onto it, and an alert feed fed by the rules engine. Devices that can act — pumps and aerators — take commands queued right from the actuator panel.

1. **Register devices.** Create a device (name, zone, kind), copy its token into the reporter — freshness shows **live / idle / offline**.
2. **Set the rules.** Metric, above or below, threshold, severity (info / warning / critical), cooldown and the action to fire — the chart draws each threshold as a dashed line.
3. **Work the alert feed.** Warning-and-above alerts land here and go out by **WhatsApp** to the farm's alert phones (deduplicated); acknowledge or resolve as you act.
4. **Act, or ask.** Queue **pump / aerator on-off** from the actuator panel, or ask the **AI advisor** — it reads the same telemetry and rules and explains what needs attention now.

> **No device on a pond yet?** Enter readings by hand — manual entries join the same series, so baselines and initial figures from the ground are keyed in from this page too.

WRAP-UP

The daily close — a five-minute routine

Run this at the end of every trading day. It takes five minutes and it is the difference between a business you can trust and a spreadsheet you can't.

- [ ] Record every harvest from the day — cages, ponds, hatchery.
- [ ] Every outlet sale logged with its cash taken.
- [ ] Owed queue reviewed; payments recorded as they came in.
- [ ] Low-stock alerts cleared or restock planned.
- [ ] On-the-road deliveries closed out — every rider delivered or accounted for.
- [ ] Farm alerts cleared — pumps and aerators acted on; devices still reporting live.
- [ ] Send-out balances match what physically left for each outlet.
- [ ] POS orders closed out; no stray open carts.
- [ ] Overdue credit chased — a call or an M-Pesa request.
- [ ] Site content checked if a promo or price changed today.
- [ ] Dispatch map glance — any faded (no-signal) rider followed up.
- [ ] Camera wall scanned — gates and ponds secure for the night.

When something looks wrong. The Activity Log records who changed what, and when. If a number doesn't reconcile, start there before you re-enter anything.
